Plugging into the Future: An Exploration of Electricity Consumption Patterns using Tableau

Understanding the Electricity Consumption Problem

The project is about looking at electricity consumption data to see how people use energy in states, regions, cities and at different times. We want to find out what patterns and trends we can see in the data. This will help us manage energy better and plan for the future. We are talking about electricity consumption data here. We want to understand electricity consumption patterns.

Collecting Electricity Consumption Data

- We need to get electricity consumption data from sources that we can trust.
- The data should include things like the state, region, year, month and how much electricity was used.
- We have to make sure the electricity consumption data is accurate and complete.

Preparing Electricity Consumption Data

- We have to remove any duplicate or missing values from the electricity consumption data.
- We need to make sure the dates and numbers are in the format.
- We have to organize the electricity consumption data so it's easy to analyze and visualize.

Analyzing Electricity Consumption Data

- We will create dashboards to show how much electricity was used each year and each month.
- We will look at how electricity usage changed after lockdowns.
