4.2 – Proposed Solution

The proposed solution for "Plugging into the Future: An Exploration of Electricity Consumption Patterns" is to create a system that people can use to look at electricity consumption data in a way using Tableau. This system will take in electricity consumption data. Turn it into something that makes sense through pictures and charts that change.

The solution wants to do these things:

- Look at how people use electricity in years and places.
- Find out if there are patterns or times when people use electricity than usual.
- Make it easy for people to look at the data and understand it.
- Compare how different groups of people use electricity at times.
- Help people make decisions about using energy by giving them good information.
- Help the people who make rules the people who give us electricity and the people who study this stuff understand how people use electricity so they can plan for the future.

By taking the raw electricity data and turning it into something that people can understand the proposed system will make it easier to keep an eye, on electricity consumption predict what will happen in the future and manage how people use electricity. The “Tableau” system will make it easy to look at the “electricity consumption patterns” and understand the “electricity consumption” data.
