

CHAPTER – X

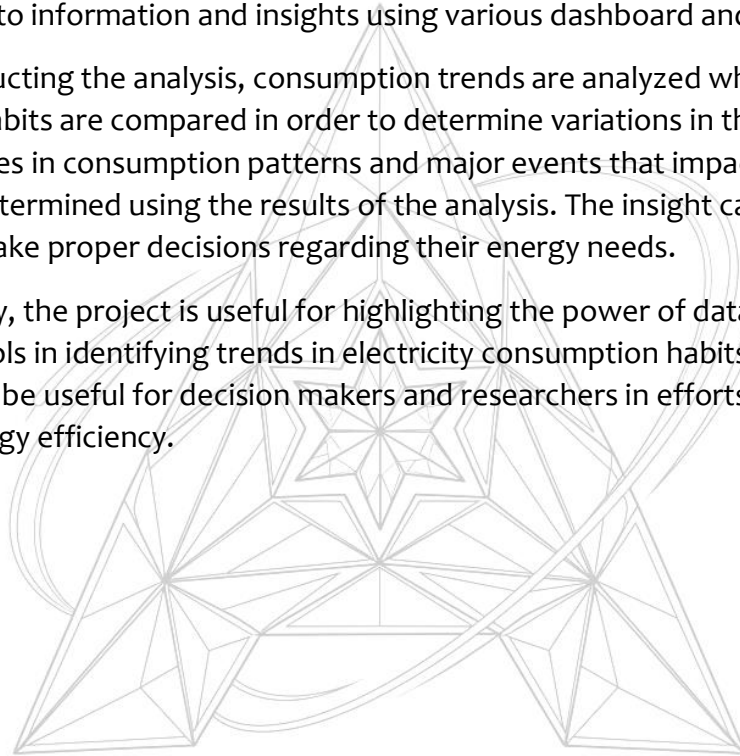

CONCLUSION

10.1 – Conclusion

Incorporating Data Analytics to Explore Electric Consumption Behaviors is an attempt to analyze electricity consumption behaviors through time and across different geographic areas. Through the use of Tableau, the project converts data on electricity consumption into information and insights using various dashboard and chart options.

By conducting the analysis, consumption trends are analyzed while regional consumption habits are compared in order to determine variations in the use of energy. Seasonal changes in consumption patterns and major events that impact consumption levels can be determined using the results of the analysis. The insight can therefore help stakeholders make proper decisions regarding their energy needs.

Generally, the project is useful for highlighting the power of data analysis and visualization tools in identifying trends in electricity consumption habits. The insight from the analysis will be useful for decision makers and researchers in efforts aimed at promoting energy efficiency.
